# Screen shots

The game starts here, in order to go to the main page, click START. This page is designed using basic HTML5, CSS3, and Javascript. The images used in this webpage are stored in 'img' folder inside the zip.
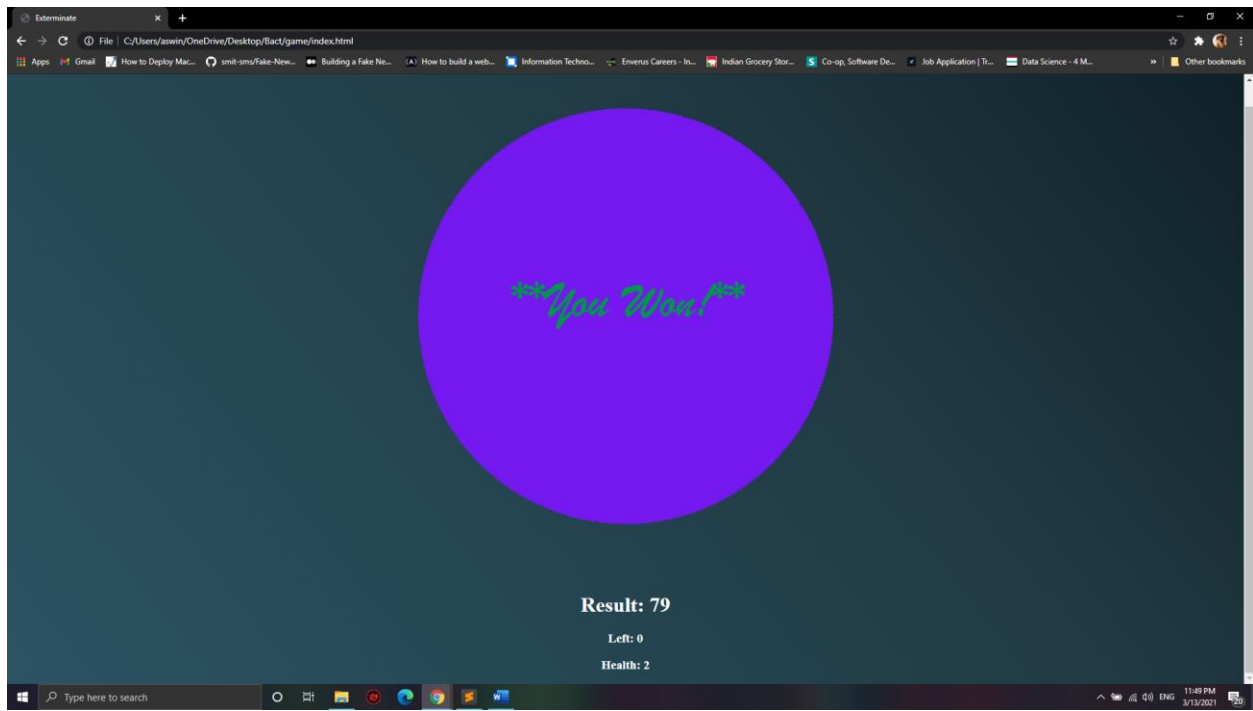

Once the second page is loaded, the bacteria will start growing around the circumference of the circle in different colors (which will grow quickly and need to be destroyed to win the game). The result will increase according to the bacteria kill count, the 'left' part shows the number of bacteria still alive and if you scroll down, 'health' is shown, which is the total number of lives the user have.
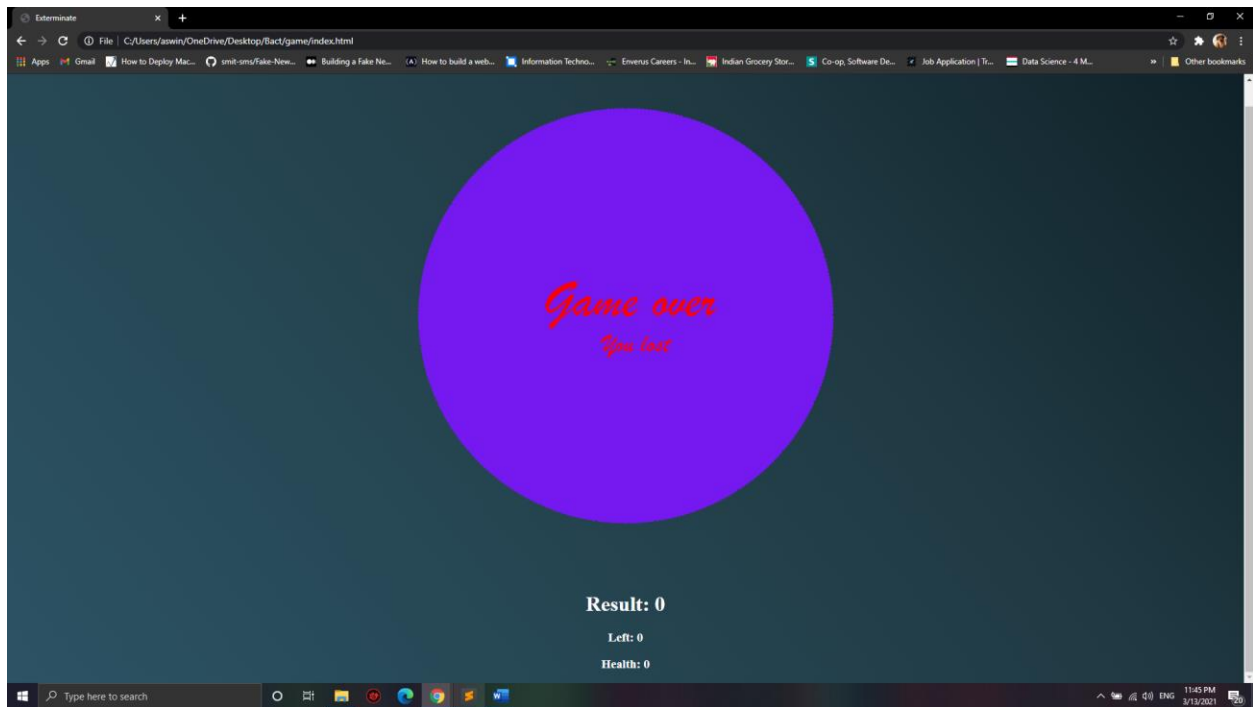

As you can see, once the bacteria is destroyed. The particles will explode as shown. And you will see the increasing number of scores. And decreasing number in 'left'.

When two bacterias collide, the larger one will engulf the smaller one (due to the higher speed it was unable to capture the image at exact time, so in order to view it please proceed with the game).

As you can see, once all the bacteria is destroyed. The above message will show up in green, and you will see the total result you've gained and the number of bacteria left will be 0 along with the remaining health.

Once you lose the game, this message in red will show up. I order to restart the game press F5 or refresh the webpage.
